

## 7.013 Central Dogma Section-Replication/Transcription/Translation

### Part 1

Shown below is a 240 base pair segment of a modified version of an *E. coli* gene. It includes the promoter and the first codons of the gene.

The sequences of both strands of the DNA duplex are shown in Figure 1. The top strand reads 5' to 3' left to right (1 to 240); the bottom, complimentary, strand reads 5' to 3' right to left (240 to 1).

```

5' -ATGTGAGTTAGCTCACTCATTAGGCACCCAGGCTTTTACTTTATGCTTCCGGCTCGTA
1  -----+-----+-----+-----+-----+-----+-----+ 60
3' -TACTACTCAATCGAGTGAGTAATCCGTGGGGTCCGAAATGTGAAATACGAAGGCCGAGCAT

      TGTGTGTGGAATTGTGAGCGGATAACAATGTCCACACAGGAAACAGCTAAGACCATGTTT
61  -----+a-----+-----+-----d---e---f-----c+-----+ 120
      ACAACACACCTTAACACTCGCCTATTGTTACAGTGTGTCCTTTGTCGATTCTGGTACAAA

      ACGCCAAGCTCGGAATTAACCCTCACTAAAGGGAACAAAAGCTGGAGCTCCACCGCGGTG
121 -----+-----+-----g-+-----+-----+-----+ 180
      TGCGGTTTCGAGCCTTAATTGGGAGTGATTCCCTTGTTTTTCGACCTCGAGGTGGCGCCAC

      GCGGCCGCTCTAGAAGTAGTGGATCCCCGGGCTGCAGGCATTCGATATCAAGCTTATCG-3'
181 -----+-----+-----+-----+-----+-----+x-----+ 240
      CGCCGCGGAGATCTTGATCACCTAGGGGGCCCGACGTCCGTAAGCTATAGTTTGAATAGC-5'
    
```

a) RNA polymerase binds to the sequence (underlined above) and shown below.

```

5' -...CTTTACTTT...14bp space...TATGTTG...-3'
      |||||
3' -...GAAATGTGAAA...14bp space...ATACAAC...-5'
    
```

Once bound, RNA polymerase starts making mRNA at the 6th nucleotide after the end of the sequence (at position **a**, also underlined above). Synthesis of the mRNA proceeds 5' to 3' left to right on the sequence above. Write the sequence of the first 10 nucleotides of the resulting mRNA.

b) What are the first five amino acids of the resulting protein?

c) Does translation terminate at the underlined TAA at position 108 (c, bold)? Why or why not?

d) How would your answer to b) change if the C/G base pair at position 95 (**d**, bold) was deleted?

e) How would your answer to b) change if an A/T base pair were added between 98 & 99 (**e**, bold)?

f) How would your answer to b) change if the A/T base pair at position 103 (**f**, bold) were changed to G/C?

g) Give a single base change (substitution, deletion, or addition of a single base and its partner on the other strand) that would cause termination of the polypeptide chain at TAA codon 147 (**g**, underlined).

h) Give a nonsense mutation (codon --> stop codon).

i) Give a missense mutation (codon --> codon for another amino acid).

j) Give a silent mutation (codon ---> codon for the same amino acid).

## Part 2

Given the sequences on these next two pages, your goal is to draw a schematic of the *con-6* gene. Determine the transcription start and stop sites, start and stop codons, untranslated regions, introns and exons.

```

Figure 2: Sequence alignment of *con-6* genomic DNA and mRNA sequences. The top line of each pair of sequences is the sequence of *con-6* genomic DNA. The genomic DNA nucleotides are numbered as in figure 1. The bottom line is the sequence of a *con-6* mRNA isolated from *Neurospora crassa*. The nucleotide numbers of the mRNA begin at the 5' end with #1, and end with #539 at the 3' end. Vertical dashes indicate nucleotides identical in both sequences. Dots indicate nucleotides in the genomic sequence that are not found in the mRNA sequence. (@ represents 5' G-cap)

**Part 2 continued**

Given the previous figures draw a schematic of the *con-6* gene below. Include the transcription start and stop sites, start and stop codons, untranslated regions, introns and exons.
