

Interactive and Non-Linear Narrative: Theory and Practice

21W.765J, 21L.489J, CMS.845

Assignment Final Project:

Please choose one of the following ideas for your final project. Other options are possible too but please discuss them with me first. The final project can either be an individual or a group project. Project concepts will be presented in one class session, followed by first prototypes, then final projects.

- 1) **Game concept**
Develop a through concept for a game that plays with the notion of multiple and parallel narratives, multiple point of views, and characters. The project also needs to provide a clear concept for the interaction of the users/gamers with the game, its characters, and the plot(s). Please document your project thoroughly and prepare a class presentation that visualizes your game concept.
- 2) **Transformation of an existing narrative into a digital space**
Similarly to the first assignment you can take an existing narrative and turn it into an interactive/non-linear story. Your project can also contain multimedia elements. The documentation needs to describe sufficiently in what way your implementation adds to the reader's experience.
- 3) **Digital multimedia project**
This project should explore notions of narrative, interactivity, character development, and interface with a variety of media such as video, audio, text, animation, images, etc. This project needs to be accompanied by a detailed documentation of the overall concept, its implementation and envisioned user experience.
- 4) **Extension of one of the previous class projects**
You can extend one of your previous class projects (non-linear narrative and audio project). The final project needs to show a significant enhancement/modification from the original version. The final project needs to be fully implemented. Documentation about the changes, the concept behind it and implementation notes need to be provided as well.

All project documentation should clearly reference the theoretical texts that we've read in this class (or others insofar you've used them for your project). All projects should also be posted to our shared site (if possible).
