## PROBLLEM 13.1

In static equilibrium, we have

$$
\begin{equation*}
-\nabla \mathrm{p}-\rho \mathrm{g} \overline{\mathrm{i}}_{\mathrm{l}}=0 \tag{a}
\end{equation*}
$$

Since $p=\rho R T$, (a) may be rewritten as

$$
\begin{equation*}
R T \frac{d \rho}{d x_{1}}+\rho g=0 \tag{b}
\end{equation*}
$$

Solving, we obtain

$$
\begin{equation*}
\rho=\rho_{0} e^{-\frac{g}{R T} x_{1}} \tag{c}
\end{equation*}
$$

PROBLEM 13.2
Since the pressure is a constant, Eq. (13.2.25) reduces to

$$
\begin{equation*}
\rho v \frac{d v}{d z}=-J_{y} B \tag{a}
\end{equation*}
$$

where we use the coordinate system defined in Fig. 13P.4. Now, from Eq. (13.2.21) we obtain

$$
\begin{equation*}
J_{y}=\sigma\left(E_{y}+v B\right) \tag{b}
\end{equation*}
$$

If the loading factor $K$, defined by Eq. (13.2.32) is constant, then

$$
\begin{equation*}
-K v B=+E \tag{c}
\end{equation*}
$$

Thus, $J_{y}=\sigma v B(1-K)$
Then

$$
\begin{equation*}
\rho v \frac{d v}{d z}=-\sigma v B^{2}(1-K) \tag{d}
\end{equation*}
$$

or

$$
\begin{equation*}
\rho \frac{d v}{d z}=-\sigma B^{2}(1-K)=-\sigma(1-K) \frac{B_{i}^{2} A_{i}}{A(z)} \tag{e}
\end{equation*}
$$

From conservation of mass, Eq. (13.2.24), we have

$$
\rho_{i} v_{i} A_{i}=\rho A(z) v
$$

(g)

Thus

$$
\begin{equation*}
\frac{\rho_{i} v_{i} A_{i}}{v} \frac{d v}{d z}=-\sigma(1-K) B_{i}^{2} A_{i} \tag{h}
\end{equation*}
$$

Integrating, we obtain

$$
\begin{equation*}
\ln v=\frac{-\sigma(1-K) B_{i}^{2}}{\rho_{i} v_{i}} z+C \tag{i}
\end{equation*}
$$

or

$$
\begin{equation*}
v=v_{i} e^{-\frac{z}{\ell}} d \tag{j}
\end{equation*}
$$

where $\ell_{d}=\frac{\rho_{i} v_{i}}{\sigma(1-K) B_{i}^{2}} \quad$ and we evaluate the arbitrary constant by realizing that $v=v_{i}$ at $z=0$.

## PROBLEM 13.3

## Part a

We assume $T, B_{o}, w, \sigma, c_{p}$ and $c_{v}$ are constant. Since the electrodes are shortcircuited, $E=0$, and so

$$
\begin{equation*}
J_{y}=v B_{0} \tag{a}
\end{equation*}
$$

We use the coordinate system defined in Fig. 13P.4. Applying conservation of energy, Eq. (13.2.26), we have

$$
\begin{equation*}
\rho v \frac{d}{d z}\left(\frac{1}{2} v^{2}\right)=0 \text {, where we have set } h=\text { constant. } \tag{b}
\end{equation*}
$$

Thus, $v$ is a constant, $v=v_{i}$. Conservation of momentum, Eq. (13.2.25), implies

$$
\begin{equation*}
\frac{d p}{d z}=-v_{i} B_{o}^{2} \tag{c}
\end{equation*}
$$

Thus, $p=-v_{i} B_{o}^{2} z+p_{i}$
The mechanical equation of state, Eq. (13.1.10) then implies

$$
\begin{equation*}
\rho=\frac{n}{R T}=-\frac{v_{i} B_{o}^{2} z+p_{i}}{R T}=\rho_{i}-\frac{v_{i} B_{o}^{2} z}{R T} \tag{e}
\end{equation*}
$$

From conservation of mass, we then obtain

$$
\begin{equation*}
\rho_{i} v_{i} w d_{i}=\left(-\frac{v_{i} B_{o}^{2} z}{R T}+\rho_{i}\right) v_{i} w d(z) \tag{f}
\end{equation*}
$$

Thus

Part b

$$
\begin{equation*}
d(z)=\frac{\rho_{i} d_{i}}{\left(\rho_{i}-\frac{v_{i} B_{o}^{2} z}{R T}\right)} \tag{g}
\end{equation*}
$$

Then

$$
\begin{equation*}
\rho(z)=\rho_{i}-\frac{v_{i} B_{o}^{2} z}{R T} \tag{h}
\end{equation*}
$$

PROBLEM 13.4
Note:
There are errors in Eqs. (13.2.16) and (13.2.31). They should read:

$$
\begin{equation*}
\frac{1}{M^{2}} \frac{d\left(M^{2}\right)}{d x_{1}}=\frac{\left\{(\gamma-1)\left(1+\gamma \mathrm{M}^{2}\right) E_{3}+\gamma\left[2+(\gamma-1) M^{2}\right] v_{1} B_{2}\right\} J_{3}}{\left(1-M^{2}\right) \gamma \gamma v_{1}} \tag{13.2.16}
\end{equation*}
$$

and

$$
\begin{align*}
\frac{1}{M^{2}} \frac{d\left(M^{2}\right)}{d x_{1}}= & \frac{1}{\left(1-M^{2}\right)}\left\{\left[(\gamma-1)\left(1+\gamma M^{2}\right) E_{3}+\dot{\gamma}\left\{2+(\gamma-1) M^{2}\right\} v_{1} B_{2}\right] \frac{J_{3}}{\gamma p v_{1}}\right. \\
& -\frac{\left.\left[2+(\gamma-1) M^{2}\right] \frac{d A}{d x_{1}}\right\}}{A} \tag{13.2.31}
\end{align*}
$$

We assume that $\sigma, \gamma, B_{o}, K$ and. $M$ are constant along the channel. Then, from the corrected form of Eq. (13.2.31), we must have

PROBLEM 13.4 (continued)
$0=\frac{1}{1-M^{2}}\left\{\left[(\gamma-1)\left(1+\gamma M^{2}\right)(-K)+\gamma\left(2+(\gamma-1) M^{2}\right)\right] \frac{v B_{o}^{2} \sigma(1-K)}{\gamma p}-\frac{\left[2+(\gamma-1) M^{2}\right]}{A} \frac{d A}{d z}\right\}$
Now, using the relations

$$
v^{2}=M^{2} \gamma R T
$$

and $\quad p=\rho R T$
we write

$$
\frac{v}{\gamma p}=\frac{M^{2}}{\rho v}
$$

(b)

$$
\begin{align*}
& \text { Thus, we obtain } \\
& \qquad \frac{1}{A^{2}} \frac{d A}{d z}=\frac{\left[(\gamma-1)\left(1+M^{2}\right)(-K)+\gamma\left(2+(\gamma-1) M^{2}\right)\right] \frac{{ }_{o}^{2} \sigma(1-K) M^{2}}{\rho V A}}{2+(\gamma-1) M^{2}} \tag{c}
\end{align*}
$$

From conservation of mass,

$$
\begin{equation*}
\rho v A=\rho_{i} v_{i} A_{i} \tag{d}
\end{equation*}
$$

Using (d), we integrate (c) and solve for $\frac{A(z)}{A_{i}}$
to obtain
where

$$
\begin{equation*}
\frac{A(z)}{A_{i}}=\frac{1}{1-\beta_{1} z} \tag{e}
\end{equation*}
$$

$$
\beta_{1}=\frac{\left[(\gamma-1)\left(1+\gamma M^{2}\right)(-K)+\gamma\left(2+(\gamma-1) M^{2}\right)\right] \sigma B_{0}^{2} M^{2}(1-K)}{\rho_{i} v_{i}\left[2+(\gamma-1) M^{2}\right]}
$$

We now substitute into Eq. $(13.2 .27)$ to obtain
$\frac{1}{v} \frac{d v}{d z}=\frac{1}{\left(1-M^{2}\right)}[(\gamma-1)(-K)+\gamma] \frac{\mathrm{vB}_{0}^{2}(1-K) \sigma}{\gamma p}-\frac{1}{A} \frac{d A}{d z}$
Thus may be rewritten as
$\frac{1}{v} \frac{d v}{d z}=\frac{1}{\left(1-M^{2}\right)}\left[[(\gamma-1)(-K)+\gamma] \frac{\sigma B_{o}^{2}(1-K) M^{2}}{\rho_{i} v_{i} A_{i}}-\frac{\beta_{i}}{A_{i}}\right] A$
(g)

Solving, we obtain

$$
\begin{equation*}
\ln v=\frac{-\beta_{2}}{\beta_{1}} \ln \left(1-\beta_{1} z\right)+\ln v_{i} \tag{h}
\end{equation*}
$$

or

$$
\begin{align*}
& \frac{v(z)}{v_{i}}=\left(1-\beta_{1} z\right)^{-\beta_{2} / \beta_{1}}  \tag{i}\\
& \text { where } \quad \beta_{2}=\frac{1}{\left(1-M^{2}\right)} \frac{[(\gamma-1)(-K)+\gamma] \sigma B_{0}^{2}(1-K) M^{2}-\beta_{1}}{\rho_{i} v_{i}}
\end{align*}
$$

Now the temperature is related through Eq. (13.2.12), as

## PROBLEM 13.4 (continued)

$$
\begin{equation*}
\mathrm{m}^{2} \gamma \mathrm{RT}=\mathrm{v}^{2} \tag{j}
\end{equation*}
$$

Thus

$$
\begin{equation*}
\frac{T(z)}{T_{i}}=\left(\frac{v}{v_{i}}\right)^{2} \tag{k}
\end{equation*}
$$

From (d), we have

$$
\frac{\rho(z)}{\rho_{i}}=\frac{v_{i}}{v} \frac{A_{i}}{A}
$$

Thus, from Eq. (13.1.10)

$$
\begin{equation*}
\frac{p(z)}{p_{i}}=\frac{v_{i}}{v} \frac{A_{i}}{A} \frac{T}{T_{i}} \tag{m}
\end{equation*}
$$

Since the voltage across the electrodes is constant,

$$
\begin{equation*}
E=-\frac{V}{w(z)}=-K v(z) B_{0} \tag{n}
\end{equation*}
$$

or $\quad w(z)=\frac{K v_{i} B_{0} w_{i}}{K v(z) B_{0}}=\frac{v_{i}}{v(z)} w_{i}$
Thus, $\quad \frac{w(z)}{w_{i}}=\frac{v_{i}}{v(z)}$
Then

$$
\begin{equation*}
\frac{d(z)}{d_{i}}=\frac{A(z)}{A_{i}} \frac{{ }^{W}}{W(z)} \tag{p}
\end{equation*}
$$

Part b
We now assume that $\sigma, \gamma, B_{o}, K$ and $v$ are constant along the channel. Then, from Eq. (13.2.27) we have
$0=\frac{1}{\left(1-M^{2}\right)}\left\{[(\gamma-1)(-K)+\gamma] v_{i} B_{o}^{2} \frac{(1-K) \sigma}{\gamma p}-\frac{1}{A} \frac{d A}{d z}\right\}$
But, from Eq. (13.2.25) we know that

$$
\frac{p}{p_{i}}=1-\frac{(1-K) \sigma v_{i} B_{o}^{2} z}{p_{i}}=1-\beta_{3} z
$$

where $\beta_{3}=(1-K) \frac{\sigma v_{i} B_{o}^{2}}{p_{i}}$
Substituting the results of (b), into (a) and solving for $\frac{A(z)}{A_{i}}$, we obtain

$$
\begin{equation*}
\frac{A(z)}{A_{i}}=\left(\frac{p}{p_{i}}\right)^{-\beta_{4} / \beta_{3}} \tag{t}
\end{equation*}
$$

where $\beta_{4}=[(\gamma-1)(-K)+\gamma] \frac{v_{i} B_{o}^{2}}{\gamma p_{i}}(1-K) \sigma$
From conservation of mass,

$$
\begin{equation*}
\frac{\rho(z)}{\rho_{i}}=\frac{A_{i}}{A(z)} \tag{u}
\end{equation*}
$$

## PROBLEM 13.4 (continued)

and so, from Eq. (13.1.10)

$$
\frac{T(z)}{T_{i}}=\frac{p(z)}{p_{i}} \frac{\rho_{i}}{\rho(z)}
$$

As in (p)

$$
\begin{equation*}
\frac{w(z)}{w_{i}}=\frac{v_{i}}{v(z)}=1 \tag{w}
\end{equation*}
$$

Thus

$$
\begin{equation*}
\frac{d(z)}{d_{i}}=\frac{\Lambda(z)}{A_{i}} \tag{x}
\end{equation*}
$$

Part $c$
We wish to find the length $\ell$ such that

$$
\begin{equation*}
\frac{C_{p} T(\ell)+\frac{1}{2}[v(\ell)]^{2}}{C_{p} T(0)+\frac{1}{2}[v(0)]^{2}}=.9 \tag{y}
\end{equation*}
$$

For the constant $M$ generator of part (a), we obtain from (i) and (k)

$$
\frac{C_{p}\left[\frac{v(\ell)}{v_{i}}\right]^{2} T_{i}+\frac{1}{2}[v(\ell)]^{2}}{C_{p}\left[\frac{v}{v_{i}}\right]^{2} T_{i}+\frac{1}{2}[v(0)]^{2}}=\frac{C_{p}\left(1-\beta_{1} \ell\right)^{-2 \beta_{2} / \beta_{1}} T_{i}+\frac{1}{2}\left[v_{i}\left(1-\beta_{1} \ell\right)\right]^{-2 \beta_{2} / \beta_{1}}}{C_{p} T_{i}+\frac{1}{2} v_{i}^{2}}=.9
$$

Reducing, we obtain

$$
\begin{equation*}
\left(1-\beta_{1} \ell\right)^{-2 \beta_{2} / \beta_{1}}=.9 \tag{aa}
\end{equation*}
$$

Substituting the given numerical values, we have

$$
\beta_{1}=.396 \text { and } \beta_{2} / \beta_{1}=-7.3 \times 10^{-2}
$$

We then solve (aa) for $\ell$, to obtain

## $\ell \approx 1.3$ meters

For the constant $v$ generator of part (b), we obtain from (s), ( $t$ ), (u) and (v)

$$
\begin{equation*}
\frac{C_{p} T_{i}\left[\frac{p(\ell)}{p_{i}} \frac{\rho_{i}}{\rho(\ell)}\right]+\frac{1}{2} v_{i}^{2}}{C_{p} T_{i}+\frac{1}{2} v_{i}^{2}}=.9 \tag{bb}
\end{equation*}
$$

or

$$
\begin{equation*}
\frac{C_{p} T_{i}\left(1-\beta_{3} \ell\right)^{\left(1-\beta_{4} / \beta_{3}\right)}+\frac{1}{2} v_{i}^{2}}{C_{p} T_{i}+\frac{1}{2} v_{i}^{2}}=.9 \tag{cc}
\end{equation*}
$$

Substituting the given numerical values, we have

PROBLEM 13.4 (continued)

$$
\beta_{3}=.45 \text { and } \beta_{4} / \beta_{3}=.857
$$

Solving for $\ell$, we obtain

$$
\ell \quad \approx 1.3 \text { meters. }
$$

PROBLEM 13.5
We are given the following relations:

$$
\begin{aligned}
& \frac{B(z)}{B_{i}}=\frac{E(z)}{E_{i}}=\frac{w_{i}}{w(z)}=\frac{d_{i}}{d(z)}=\left(\frac{A_{i}}{A(z)}\right)^{1 / 2}
\end{aligned}
$$

and that $v, \sigma, \gamma$, and $K$ are constant.
Part a
From Eq. (13.2.33),

$$
J=(1-K) o v B
$$

(a)

For constant velocity, conservation of momentum yields

$$
\begin{equation*}
\frac{d p}{d z}=-(1-K) \sigma v B^{2} \tag{b}
\end{equation*}
$$

Conservation of energy yields

$$
\begin{equation*}
\rho v C_{p} \frac{d^{\prime} \Gamma}{d z}=-K(1-K) \sigma(v B)^{2} \tag{c}
\end{equation*}
$$

Using the equation of state,

$$
\begin{equation*}
\mathrm{p}=\rho R T \tag{d}
\end{equation*}
$$

we obtain
or

$$
\begin{equation*}
T \frac{d \rho}{d z}+\rho \frac{d T}{d z}=-\frac{(1-K)}{R} \sigma v B^{2} \tag{e}
\end{equation*}
$$

$$
\begin{equation*}
T \frac{\mathrm{~d} \rho}{\mathrm{~d} z}+\frac{(-K)(1-K) \sigma V B^{2}}{\mathrm{C}_{\mathrm{p}}}=-\frac{(1-K) \sigma v B^{2}}{R} \tag{f}
\end{equation*}
$$

Thus,

$$
\begin{equation*}
T \frac{d \rho}{d z}=\sigma v B^{2}(1-K)\left(-\frac{1}{R}+\frac{K}{c_{p}}\right) \tag{g}
\end{equation*}
$$

Also

$$
B^{2}=\frac{B_{i}{ }^{2}\left(A_{i}\right)}{A(z)}
$$

and

$$
\rho_{i} A_{i}=\rho(z) A(z)
$$

Therefore $\quad T \frac{d \rho}{d z}=\frac{\sigma_{V B_{i}^{2}}(1-K)\left(-\frac{1}{R}+\frac{K}{C_{p}}\right)}{\rho_{i}} \rho(z)$

$$
\begin{equation*}
\rho c_{p} \frac{d T}{d z}=-K(1-K) \sigma v \frac{B_{i}^{2} \rho}{\rho_{i}} \tag{}
\end{equation*}
$$

## PROBLEM 13.5 (continued)

and so

$$
\frac{d T}{d z}=-\frac{K(1-K) \sigma v B_{i}^{2}}{\rho_{i} c_{p}}
$$

Therefore

$$
\begin{equation*}
T=-K(1-K) \frac{\sigma_{v B_{i}}^{2}}{\rho_{i} c_{p}} z+T_{i} \tag{k}
\end{equation*}
$$

Let

$$
\alpha=\frac{-K(1-K) \sigma v B_{i}^{2}}{\rho_{i} c_{p}}
$$

Then

$$
\begin{align*}
& T=T_{i}\left(\frac{\alpha z}{T_{i}}+1\right)  \tag{m}\\
& \frac{d \rho}{\rho}=\frac{+\sigma v B_{i}^{2}(1-K)\left(\frac{K}{C_{p}}-\frac{1}{R}\right)}{\rho_{i}\left(\alpha z+T_{i}\right)} d z \tag{n}
\end{align*}
$$

We let

$$
\begin{aligned}
\beta & =\frac{+\sigma v B_{i}^{2}(1-K)\left(\frac{K}{c_{p}}-\frac{1}{R}\right)}{\rho_{i}} \alpha \\
& =\frac{c_{p}}{K R}-1
\end{aligned}
$$

Integrating ( n ), we then obtain
or

$$
\ln \rho=\beta \ln \left(\alpha z+T_{i}\right)+\text { constant }
$$

$$
\begin{equation*}
\rho=\rho_{i}\left(\frac{\alpha z}{T_{i}}+1\right)^{\beta} \tag{o}
\end{equation*}
$$

Therefore

$$
\begin{equation*}
A(z)=\frac{A_{i}}{\left(\frac{\alpha z}{T_{i}}+1\right)^{B}} \tag{p}
\end{equation*}
$$

Part b
From (m),

$$
\frac{T(\ell)}{T_{i}}=\frac{\alpha \ell+T_{i}}{T_{i}}=.8
$$

or

$$
\frac{\alpha \ell}{T_{i}}=-.2
$$

Now

$$
\frac{\alpha}{T_{i}}=-\frac{K(1-K) \sigma v_{i} B_{i}^{2}}{\rho_{i} c_{p} T_{i}}
$$

But

$$
c_{p} T_{i}=\frac{R T_{i}}{\left(1-\frac{1}{\gamma}\right)}=\frac{p_{i}}{\rho_{1}\left(1-\frac{1}{\gamma}\right)}=2.5 \times 10^{6}
$$

## PROBLEM 13.5 (Continued)

Thus

$$
\frac{\alpha}{T_{i}}=\frac{-.5(.5) 50(700) 16}{.7\left(2.5 \times 10^{6}\right)}=-8.0 \times 10^{-2}
$$

Solving for $\ell$, we obtain

$$
\ell=\frac{.2}{8} \times 10^{2}=1.25 \text { meters }
$$

Part c

$$
\rho=\rho_{i}\left(\frac{\alpha z}{T_{i}}+1\right)^{\beta}
$$

Numerically

$$
B=\frac{c_{p}}{K R}-1=\frac{1}{\left(1-\frac{1}{\gamma}\right) K}-1 \approx 6
$$

Thus

$$
\rho(z)=.7(1-.08 z)^{6}
$$

Then it follows:

$$
\begin{aligned}
& \mathrm{p}(z)=\rho R T=p_{i}(1-.08 z)^{7}=5 \times 10^{5}(1-.08 z)^{7} \\
& T(z)=T_{i}(1-.08 z)
\end{aligned}
$$

From the given information, we cannot solve for $T_{i}$, only for

$$
\begin{aligned}
\mathrm{RT}_{i}= & \frac{\mathrm{p}_{i}}{\rho_{i}}=\frac{v_{i}^{2}}{\gamma M_{i}^{2}} \approx 7 \times 10^{5} \\
M^{2}(z) & =\frac{v_{i}^{2}}{\gamma R T(z)}=\frac{v_{i}^{2}}{\gamma p(z)} \rho(z)=\frac{v_{i}^{2}}{\gamma} \frac{\rho_{i}\left(\frac{\alpha z}{T_{i}}+1\right)^{\beta}}{p_{i}\left(\frac{\alpha z}{T_{i}}+1\right)^{(\beta+1)}} \\
& =\frac{.5}{1-.08 z}
\end{aligned}
$$

Now

Part d
The total electric power drawn from this generator is

$$
\begin{aligned}
\mathrm{p}^{e} & =V I=-E(z) w(z) J(z) \ell d(z) \\
& =-E(z)(1-K) \sigma v B(z) \ell d(z) w(z) \\
& =-E_{i} w_{i}(1-K) \sigma v B_{i} d_{i} \ell
\end{aligned}
$$

But

$$
E_{i}=-K v B_{i}
$$

Thus

$$
\begin{aligned}
\mathrm{p}^{\mathrm{e}} & =\mathrm{K}\left(\mathrm{vB}_{i}\right)^{2} \mathrm{w}_{i} \mathrm{~d}_{\mathrm{i}} \sigma(1-\mathrm{K}) \ell \\
& =.5(700)^{2} 16(.5) 50(.5) 1.25 \\
& =61.3 \times 10^{6} \text { watts }=61.3 \text { megawatts }
\end{aligned}
$$

## PROBLEM 13.6

## Part a

We are given that

$$
\begin{equation*}
\bar{E}=\bar{i}_{x} \frac{4}{3} \frac{V_{o}}{L^{4 / 3}} x^{1 / 3} \tag{a}
\end{equation*}
$$

and

$$
\begin{equation*}
\rho_{e}=\frac{4}{9} \frac{\varepsilon_{0} V_{0}}{L^{4 / 3} x^{2 / 3}} \tag{b}
\end{equation*}
$$

The force equation in the steady state is

$$
\begin{equation*}
\rho_{m} v_{x} \frac{d v_{x}}{d x} \bar{I}_{x}=\rho_{e} \bar{E} \tag{c}
\end{equation*}
$$

Since $\rho e^{/ \rho_{m}}=q / m=$ constant, we can write

$$
\begin{equation*}
\frac{d}{d x}\left(\frac{1}{2} v_{x}^{2}\right)=\frac{q}{m} \frac{4}{3} \frac{v_{0}}{L^{4 / 3}} x^{1 / 3} \tag{d}
\end{equation*}
$$

Solving for $\mathbf{v}_{\mathbf{x}}$ we obtain

$$
\begin{equation*}
v_{x}=\sqrt{\frac{2 q}{m} v_{o}}\left(\frac{x}{L}\right)^{2 / 3} \tag{e}
\end{equation*}
$$

Part b
The total force per unit volume acting on the accelerator system is

$$
\begin{equation*}
\bar{F}=\rho_{e} \bar{E} \tag{f}
\end{equation*}
$$

Thus, the total force which the fixed support must exert is

$$
\begin{aligned}
\bar{f}_{\text {total }} & =-\int F d V \bar{i}_{x} \\
& =-\int_{0}^{\ell} \frac{16}{27} \frac{\varepsilon_{0} V_{o}^{2}}{L^{8 / 3}} x^{-1 / 3} \text { Adx } \bar{i}_{x} \\
\overline{\mathbf{f}}_{\text {total }} & =-\frac{8}{9} \frac{\varepsilon_{0} V_{0}^{2}}{L^{2}} A \overline{\mathrm{i}}_{x}
\end{aligned}
$$

PROBLEM 13.7

## Part a

We refer to the analysis performed in section 13.2.3a. The equation of motion for the velocity is, Eq. (13.2.76),

$$
\begin{equation*}
\frac{\partial^{2} v}{\partial t^{2}}=a^{2} \frac{\partial^{2} v}{\partial x_{1}}{ }^{2} \tag{a}
\end{equation*}
$$

The boundary conditions are

$$
\begin{aligned}
& v(-L)=V_{0} \cos \omega t \\
& v(0)=0
\end{aligned}
$$

We write the solution in the form

PROBLEM 13.7 (continued)

$$
\begin{equation*}
v\left(x_{1} t\right)=\operatorname{Re}\left[A e^{j\left(\omega t-k x_{1}\right)}+B e^{j\left(\omega t+k x_{1}\right)}\right] \tag{b}
\end{equation*}
$$

where $k=\frac{\omega}{a}$

Using the boundary condition at $x_{1}=0$, we can alternately write the solution as
$v=\operatorname{Re}\left[A \sin k x_{1} e^{j \omega t}\right]$
Applying the other boundary condition at $x_{1}=-L$, we finally obtain

$$
\begin{equation*}
v\left(x_{1}, t\right)=-\frac{V_{0}}{\sin k L} \sin k x_{1} \cos \omega t . \tag{d}
\end{equation*}
$$

The perturbation pressure is related to the velocity through Eq. (13.2.74)

$$
\begin{equation*}
\rho_{0} \frac{\partial v^{\prime}}{\partial t}=-\frac{\partial p^{\prime}}{\partial x_{1}} \tag{e}
\end{equation*}
$$

Solving, we obtain

$$
\begin{equation*}
\frac{\rho_{\mathrm{o}} V_{o} \omega}{\operatorname{sinkL}} \sin k x_{1} \sin \omega t=-\frac{\partial \mathrm{p}^{\prime}}{\partial \mathrm{x}_{1}} \tag{f}
\end{equation*}
$$

or

$$
\begin{equation*}
p^{\prime}=\frac{\rho_{0} V_{0} \omega}{k \sin k L} \cos k x_{1} \sin \omega t \tag{g}
\end{equation*}
$$

where $\rho_{0}$ is the equilibrium density, related to the speed of sound $a$, through Eq. (13.2.83).
Thus, the total pressure is
$p=p_{0}+p^{\prime}=p_{0}+\frac{\rho_{0} v_{0} \omega}{k \sin k L} \cos k x_{1} \sin \omega t$
and the perturbation pressure at $x_{1}=-L$ is
$p^{\prime}(-L, t)=\frac{\rho_{0} V_{0} a}{\sin k L} \cos k L \sin \omega t$
Part b
There will be resonances in the pressure if
$\sin k L=0$
or $\quad k L=n \pi \quad n=1,2,3 \ldots$
Thus

$$
\begin{equation*}
\omega=\frac{\mathrm{n} \pi}{\mathrm{~L}} \mathrm{a} \tag{l}
\end{equation*}
$$

PROBLEM 13.8

## Part a

We carry through an analysis similar to that performed in section 13.2 .3 b . We assume that

$$
\begin{aligned}
& \bar{E}=\bar{i}_{2} E_{2}\left(x_{1}, t\right) \\
& \bar{J}=\bar{i}_{2} J_{2}\left(x_{1}, t\right)
\end{aligned}
$$

PROBLEM 13.8

$$
\bar{B}=\bar{i}_{3}\left[\mu_{0} H_{0}+\mu_{0} H_{3}^{\prime}\left(x_{1}, t\right)\right]
$$

Conservation of momentum yields

$$
\begin{equation*}
\frac{D v_{1}}{\rho D}=-\frac{\partial p}{\partial x_{1}}+J_{2} \mu_{0}\left(H_{0}+H_{3}^{\prime}\right) \tag{a}
\end{equation*}
$$

Conservation of energy gives us

$$
\begin{equation*}
\rho \frac{D}{D t}\left(u+\frac{1}{2} v_{1}^{2}\right)=-\frac{\partial}{\partial x_{1}}\left(p v_{1}\right)+J_{2} E \tag{b}
\end{equation*}
$$

We use Ampere's and Faraday's laws to obtain

$$
\begin{align*}
& \frac{\partial H_{3}^{\prime}}{\partial x_{1}}=-J_{2}  \tag{c}\\
& \frac{\partial E_{2}}{\partial x_{1}}=-\frac{\mu_{0} \partial H_{3}^{\prime}}{\partial t} \tag{d}
\end{align*}
$$

while
Ohm's law yields

$$
\begin{equation*}
\underset{\rightarrow \infty}{\mathrm{J}_{2}}=\sigma\left[\mathrm{E}_{2}-\mathrm{v}_{1} \mathrm{~B}_{3}\right] \tag{e}
\end{equation*}
$$

Since $\sigma \rightarrow \infty$

$$
\begin{equation*}
E_{2}=v_{1} B_{3} \tag{f}
\end{equation*}
$$

We linearize, as in Eq. (13.2.91), so $E_{2} \approx v_{1} \mu_{0} H_{0}$
Substituting into Faraday's law

$$
\begin{equation*}
\mu_{0} H_{o} \frac{\partial v_{1}}{\partial x_{1}}=-\mu_{o} \frac{\partial H_{3}^{\prime}}{\partial t} \tag{g}
\end{equation*}
$$

Linearization of the conservation of mass yields

$$
\begin{equation*}
\frac{\partial \rho^{\prime}}{\partial t}=-\rho_{0} \frac{\partial v_{1}}{\partial x_{1}} \tag{h}
\end{equation*}
$$

Thus, from (g)

$$
\begin{equation*}
\frac{\mu_{0} H_{0}}{\rho_{0}} \frac{\partial \rho^{\prime}}{\partial t}=\mu_{0} \frac{\partial H^{\prime}}{\partial t} \tag{i}
\end{equation*}
$$

Then

$$
\frac{H_{0}}{H_{3}^{\prime}}=\frac{\rho_{0}}{\rho^{\prime}}
$$

Linearizing Eq. (13.2.71), we obtain

$$
\begin{equation*}
\frac{D p^{\prime}}{D t}=\frac{\gamma p_{o}}{\rho_{0}} \frac{D \rho^{\prime}}{D t} \tag{k}
\end{equation*}
$$

```
ELECTROMECHANICS OF COMPRESSIBLE, INVISCID FLUIDS
```

## PROBLEM 13.8 (continued)

Defining the acoustic speed

$$
\begin{gathered}
a_{s}=\left(\frac{\gamma p_{0}}{\rho_{0}}\right)^{1 / 2} \text { where } p_{0} \text { is the equilibrium pressure, } \\
p_{0}=p_{1}-\frac{\mu_{0} H_{0}^{2}}{2}
\end{gathered}
$$

we have

$$
p^{\prime}=a_{s}^{2} \rho^{\prime}
$$

Linearization of convervation of momentum (a) yields

$$
\begin{equation*}
\rho_{0} \frac{\partial v_{1}}{\partial t}=-\frac{\partial p^{\prime}}{\partial x_{1}}-\frac{\partial H^{\prime}}{\partial x_{1}} \mu_{0} H_{0} \tag{m}
\end{equation*}
$$

or, from ( j ) and ( $\ell$ ),

$$
\begin{equation*}
\rho_{0} \frac{\partial v_{1}}{\partial t}=\frac{\partial \rho^{\prime}}{\partial x_{1}}\left(-a_{s}^{2}-\frac{\mu_{0} H_{o}^{2}}{\rho_{0}}\right) \tag{n}
\end{equation*}
$$

Differentiating ( $n$ ) with respect to time, and using conservation of mass ( $h$ ), we finally obtain

$$
\begin{equation*}
\frac{\partial^{2} v_{1}}{\partial t^{2}}=\left(a_{s}^{2}+\frac{\mu_{0} H_{o}^{2}}{\rho_{0}}\right) \frac{\partial^{2} v_{1}}{\partial x_{1}^{2}} \tag{o}
\end{equation*}
$$

Defining

$$
a^{2}=a_{s}^{2}+\frac{\mu_{o} H_{o}^{2}}{\rho_{o}}
$$

$$
\begin{equation*}
\frac{\partial^{2} v_{1}}{\partial t^{2}}=a^{2} \frac{\partial^{2} v_{1}}{\partial x_{1}^{2}} \tag{q}
\end{equation*}
$$

Part b
We assume solutions of the form

$$
\begin{equation*}
v_{1}=\operatorname{Re}\left[A_{1} e^{j\left(\omega t-k x_{1}\right)}+A_{2} e^{j\left(\omega t+k x_{1}\right)}\right] \tag{r}
\end{equation*}
$$

where $k=\frac{\omega}{a}$
The boundary condition at $x_{1}=-L$ is

$$
\begin{equation*}
V(-L, t)=V_{s} \cos \omega t=V_{s} R e e^{j \omega t} \tag{s}
\end{equation*}
$$

and at $x_{1}=0$

$$
\begin{equation*}
M \frac{d v_{1}}{d t}(0, t)=\left.p^{\prime} A\right|_{x_{1}=0}+\left.\mu_{0} H_{0} H_{3}^{\prime} A\right|_{x_{1}=0} \tag{t}
\end{equation*}
$$

From (h), (j) and ( $\ell$ ),

$$
\begin{equation*}
\frac{1}{a_{s}^{2}} \frac{\partial p^{\prime}}{\partial t}=-\rho_{0} \frac{\partial v_{1}}{\partial x_{1}} \tag{u}
\end{equation*}
$$

PROBLEM 13.8 (continued)

$$
\begin{equation*}
\frac{H_{3}^{\prime}}{H_{0}}=\frac{p^{\prime}}{a_{s}{ }^{2} \rho_{0}} \tag{v}
\end{equation*}
$$

Thus

$$
\begin{equation*}
M \frac{d v_{1}(0, t)}{d t}=A\left(\frac{\mu_{0} H_{0}^{2}}{a_{s}^{2} \rho_{0}}+1\right) p^{\prime}=A \frac{a^{2}}{a_{S}^{2}} p^{\prime} \tag{w}
\end{equation*}
$$

From (u), we solve for $\left.p^{\prime}\right|_{x_{1}=0}$ to obtain:

$$
\begin{equation*}
\left.p^{\prime}\right|_{x_{1}=0}=-\frac{\rho_{0}^{a_{s} a_{s}^{2} k}}{\omega}\left(A_{2}-A_{1}\right) e^{j \omega t} \tag{x}
\end{equation*}
$$

Substituting into (s) and ( $t$ ), we have

$$
\operatorname{Mjw}\left(A_{1}+A_{2}\right)=A\left(\frac{a}{a_{s}}\right)^{2}\left(\frac{\rho_{0} a_{s}^{2} k}{w}\right)\left(A_{1}-A_{2}\right)
$$

and

$$
A_{1} e^{+j k \ell}+A_{2} e^{-j k \ell}=v_{s}
$$

Solving for $A_{1}$ and $A_{2}$, we obtain

$$
\begin{align*}
A_{1} & =\frac{\left(M j w+A a \rho_{0}\right) V_{s}}{2\left(-M w \sin k \ell+A a \rho_{0} \cos k \ell\right)} \\
A_{2} & =\frac{\left(A a \rho_{0}-M j w\right) V_{s}}{2\left(-M w \sin k \ell+A a \rho_{0} \cos k \ell\right)} \tag{z}
\end{align*}
$$

Thus, the velocity of the piston is

$$
\begin{align*}
& v_{1}(0, t)=\operatorname{Re}\left[A_{1}+A_{2}\right] e^{j \omega t} \\
& v_{1}(0, t)=\frac{A a \rho_{0} v_{s}}{-M w \sin k \ell+A a \rho_{0} \cos k \ell} \cos \omega t \tag{aa}
\end{align*}
$$

PROBLEM 13.9
Part a
The differential equation for the velocity as derived in problem 13.8 is

$$
\begin{equation*}
\frac{\partial^{2} v_{1}}{\partial t^{2}}=a^{2} \frac{\partial^{2} v_{1}}{\partial x_{1}^{2}} \tag{a}
\end{equation*}
$$

where

$$
a^{2}=a_{s}^{2}+\frac{\mu_{0}^{1}{ }_{0}^{2}}{\rho_{0}}
$$

with

$$
a_{s}^{2}=\left(\frac{\gamma p_{0}}{\rho_{0}}\right)^{1 / 2} \text { where } p_{0}=p_{1}-\frac{\mu_{0} H_{0}^{2}}{2}
$$

Part b
We assume a solution of the form

PROBLEM 13.9 (continued)

$$
V\left(x_{1}, t\right)=\operatorname{Re}\left[D e^{j\left(\omega t-k x_{1}\right)}\right] \text { where } k=\frac{w}{a}
$$

We do not consider the negatively traveling wave, as we want to use this system as a delay line without distortion. The boundary condition at $x_{1}=-L$ is

$$
V(-L, t)=\operatorname{Re} V_{s} e^{j \omega t}
$$

and at $x_{1}=0$ is

$$
\begin{equation*}
\frac{d V^{2}(0, t)^{\prime}}{d t}=p^{\prime}(0, t) A-B V_{1}(0, t)+\mu_{0} H_{0} H_{3}^{\prime} A \tag{b}
\end{equation*}
$$

From problem 13.8, (h), (j) and ( $\ell$ )

$$
p^{\prime}=a_{s}^{2} \rho^{\prime} \quad, \frac{\partial \rho^{\prime}}{\partial t}=-\rho_{0} \frac{\partial v_{1}}{\partial x_{1}} \text { and } \frac{H^{\prime}}{H_{0}}=\frac{p^{\prime}}{a_{s}^{2} 0_{0}}
$$

Thus, (b) becomes
where

$$
\begin{equation*}
-B D e^{j \omega t}+\left(\frac{a^{2}}{a_{s}}\right)^{2} p^{\prime} A=0 \tag{c}
\end{equation*}
$$

$$
\begin{equation*}
\left.p^{\prime}\right|_{x=0}=-\frac{\rho_{0} D(-j k)}{j \omega} a_{s}^{2} e^{j \omega t} \tag{d}
\end{equation*}
$$

Thus, for no reflections

$$
\begin{equation*}
-B+\left(\frac{a}{a_{s}}\right)^{2} \frac{A \rho_{0} a_{s}^{2}}{a}=0 \tag{e}
\end{equation*}
$$

or

$$
\begin{equation*}
B=A a \rho_{0} \tag{f}
\end{equation*}
$$

PROBLEM 13.10
The equilibrium boundary conditions are

$$
\begin{aligned}
& T\left[-\left(L_{1}+L_{2}+\Delta\right), t\right]=T_{0} \\
& T\left[-\left(L_{1}+\Delta\right), t\right] A_{s}=-p_{0} A_{c}
\end{aligned}
$$

Boundary conditions for incremental motions are

1) $T\left[-\left(L_{1}+L_{2}+\Delta\right), t\right]=T_{s}(t)$
$2)-T\left[-\left(L_{1}+\Delta\right), t\right] A_{s}-p\left(-L_{1}, t\right) A_{c}=M \frac{d}{d t} v_{\ell}\left(-L_{1}, t\right)$
2) $\quad v_{\ell}\left(-L_{1}, t\right)=v_{e}\left[-\left(L_{1}+\Delta\right), t\right]$ since the mass is rigid
and $\left._{4}\right) \quad v_{\ell}(0, t)=0$ since the wall at $x=0$ is fixed.
PROBLEM 13.11
Part a
We can immediately write down the equation for perturbation velocity, using equations (13.2.76) and (13.2.77) and the results of chapters 6 and 10 .

## PROBLEM 13.11 (continued)

We replace $\partial / \partial t$ by $\partial / \partial t+v \cdot \nabla$ to obtain

$$
\begin{aligned}
& \quad\left(\frac{\partial}{\partial t}+v_{0} \frac{\partial}{\partial x}\right)^{2} v^{\prime}=a_{s}^{2} \frac{\partial^{2} v^{\prime}}{\partial x^{2}} \\
& \text { Letting } v^{\prime}=\operatorname{Re} \hat{v} e^{j(\omega t-k x)}
\end{aligned}
$$

we have

$$
\left(\omega-k V_{0}\right)^{2}=a_{s}^{2} k^{2}
$$

Solving for $w$, we obtain

$$
\omega=k\left(v_{0} \pm a_{s}\right)
$$

Part b
Solving for $k$, we have

$$
k=\frac{\omega}{V_{0} \pm a_{s}}
$$

For $V_{o}>a_{s}$, both waves propagate in the positive $x$ - direction.
PROBLEM 13.12
Part a
We assume that

$$
\begin{aligned}
& \bar{E}=\bar{i}_{z} E_{z}(x, t) \\
& \bar{J}=\bar{i}_{z} J_{z}(x, t) \\
& \bar{B}=\bar{i}_{y} \mu_{0}\left[H_{0}+H_{y}^{\prime}(x, t)\right]
\end{aligned}
$$

We also assume that all quantities can be written in the form of Eq. (13.2.91) .

$$
\begin{equation*}
\rho_{0} \frac{\partial v_{x}}{\partial t}=-\frac{\partial p^{\prime}}{\partial x}-J_{z} \mu_{0} H_{0} \quad \text { (conservation of momentum } \quad \text { linearized) } \tag{a}
\end{equation*}
$$

The relevant electromagnetic equations are

$$
\begin{equation*}
\frac{\partial H_{y}^{\prime}}{\partial x}=J_{z} \tag{b}
\end{equation*}
$$

and

$$
\begin{equation*}
\frac{\partial E_{z}}{\partial x}=\mu_{0} \frac{\partial H_{y}^{\prime}}{\partial t} \tag{c}
\end{equation*}
$$

and the constitutive law is

$$
\begin{equation*}
J_{z}=\sigma\left(E_{z}+v_{x} \mu_{0} H_{o}\right) \tag{d}
\end{equation*}
$$

We recognize that Eqs. (13.2.94), (13.2.96) and (13.2.97) are still valid, so

$$
\begin{equation*}
\frac{1}{\rho_{0}} \frac{\partial \rho^{\prime}}{\partial t}=-\frac{\partial v_{x}}{\partial x} \tag{e}
\end{equation*}
$$

## PROBLEM 13.12 (continued)

and

$$
\begin{equation*}
p^{\prime}=a_{s}^{2} \rho^{\prime} \tag{f}
\end{equation*}
$$

Part b
We assume all perturbation quantities are of the form

$$
v_{x}=\operatorname{Re}\left[\hat{v} e^{j(\omega t-k x)}\right]
$$

Using (b), (a) may be rewritten as

$$
\begin{equation*}
\rho_{0} j \hat{w v}=+j k \hat{p}+\mu_{0} H_{0} j k \hat{H} \tag{g}
\end{equation*}
$$

and (c) may now be written as

$$
\begin{equation*}
-j k \hat{E}=\mu_{0} j \omega \hat{H} \tag{h}
\end{equation*}
$$

Then, from (b) and (d)

$$
\begin{equation*}
-j k \hat{H}=\sigma\left(\hat{E}+\hat{v} \mu_{0} H_{o}\right) \tag{i}
\end{equation*}
$$

Solving (g) and (h) for $\hat{H}$ in terms of $\hat{v}$, we have

$$
\begin{equation*}
\hat{H}=\frac{\hat{v} \sigma \mu_{o} H_{o}}{\left(-j k+\sigma \mu_{o} \frac{\omega}{k}\right)} \tag{j}
\end{equation*}
$$

From (e) and (f), we solve for $\hat{p}$ in terms of $\hat{v}$ to be

$$
\begin{equation*}
\hat{p}=\frac{k}{\omega} \rho_{o} a_{s}^{2} \hat{v} \tag{k}
\end{equation*}
$$

Substituting ( j ) and (k) back into (g), we find

$$
\begin{equation*}
\hat{v}\left[\rho_{o} j \omega-\frac{j k^{2}}{\omega} \rho_{o} a_{s}^{2}-\frac{j k\left(\mu_{o} H_{o}\right)^{2} \sigma}{\left[-j k+\frac{\sigma \mu_{o} \omega}{k}\right]}\right]=0 \tag{}
\end{equation*}
$$

Thus, the dispersion relation is

$$
\begin{equation*}
\left(\omega^{2}-k^{2} a_{s}^{2}\right)-\frac{j\left(\mu_{o} H_{o}\right)^{2} \omega k^{2}}{\left(+\frac{k^{2}}{\sigma}+j \mu_{o} \omega\right) \rho_{o}}=0 \tag{m}
\end{equation*}
$$

We see that in the 1 imit as $\sigma \rightarrow \infty$, this dispersion relation reduces to the lossless dispersion relation

$$
\begin{equation*}
\omega^{2}-k^{2}\left(a_{s}^{2}+\frac{\mu_{0} H_{o}^{2}}{\rho_{0}}\right)=0 \tag{n}
\end{equation*}
$$

Part c
If $\sigma$ is very small, we can approximate (m) as

$$
\begin{equation*}
\omega^{2}-k^{2} a_{s}^{2}-j\left(\mu_{0} H_{0}\right)^{2} \frac{\omega \sigma}{\rho_{0}}\left(1-\frac{j \omega \mu_{0}^{\sigma}}{k^{2}}\right)=0 \tag{o}
\end{equation*}
$$

for which we can rewrite (o) as

PROBLEM 13.12 (continued)

$$
k^{4} a_{s}^{2}-k^{2}\left[\omega^{2}-j \omega \sigma \frac{\left(\mu_{0} H_{0}\right)^{2}}{\rho_{0}}\right]+\left(\frac{\mu_{0} H_{0}}{\rho_{0}}\right)^{2} \omega^{2} \sigma^{2} \mu_{0}=0
$$

(p)

Solving for $k^{2}$, we obtain

$$
\left.k^{2}=\frac{\omega^{2}-j \omega \sigma \frac{\left(\mu_{0} H_{o}\right)^{2}}{\rho_{0}}}{2 a_{s}^{2}} \pm \sqrt{\left[\frac{\omega^{2}-j \omega \sigma \frac{\left(\mu_{0} H_{0}\right)^{2}}{\rho_{0}}}{2 a_{s}{ }^{2}}\right.}\right]^{2}\left(\frac{\mu_{0} \omega^{2} \sigma^{2}}{\rho_{0}}\right)\left(\mu_{0} H_{o}\right)^{2} a_{s}{ }^{2}{ }^{2}
$$

q)

Since $\sigma$ is very small, we expand the radical in (q) to obtain

$$
\begin{equation*}
k^{2}=\frac{\left[\omega^{2}-j \omega \sigma \frac{\left(\mu_{0} H_{0}\right)^{2}}{\rho_{0}}\right]}{2 a_{s}{ }^{2}} \pm\left[\frac{\omega^{2}-\frac{j \omega \sigma}{\rho_{0}}\left(\mu_{0} H_{0}\right)^{2}}{2 a_{s}^{2}}-\frac{\left(\frac{\mu_{0} \omega^{2} \sigma^{2}}{\rho_{0}}\right)\left(\mu_{0} H_{0}\right)^{2}}{\left[\omega^{2}-\frac{j \omega \sigma}{\rho_{0}}\left(\mu_{0} H_{0}\right)^{2}\right]}\right] \tag{r}
\end{equation*}
$$

Thus, our approximate solutions for $\mathrm{k}^{2}$ are

$$
\begin{equation*}
k^{2} \approx \frac{\left[\omega^{2}-j \omega \sigma \frac{\left(\mu_{0} H_{o}\right)^{2}}{\rho_{0}}\right]}{a_{s}^{2}} \tag{s}
\end{equation*}
$$

and

$$
\begin{equation*}
k^{2} \approx \frac{\left(\frac{\mu_{0} \omega^{2} \sigma^{2}}{\rho_{0}}\right)\left(\mu_{0} H_{0}\right)^{2}}{\left[\omega^{2}-\frac{j \omega \sigma}{\rho_{0}}\left(\mu_{0} H_{0}\right)^{2}\right]} \approx\left(\frac{\mu_{0} \sigma^{2}}{\rho_{0}}\right)\left(\mu_{0} H_{0}\right)^{2} \tag{t}
\end{equation*}
$$

The wavenumbers for the first pair of waves are approximately:

$$
\begin{equation*}
k \approx \pm\left(\frac{\omega-j \frac{\sigma}{2 p_{o}}\left(\mu_{o} H_{o}\right)^{2}}{a_{s}}\right) \tag{u}
\end{equation*}
$$

while for the second pair, we obtain

$$
\begin{equation*}
k \approx \pm \sigma\left(\mu_{0} H_{o}\right) \sqrt{\frac{\mu_{0}}{\rho_{0}}} \tag{v}
\end{equation*}
$$

The wavenumbers from (u) represent a forward and backward traveling wave, both with amplitudes exponentially decreasing. Such waves are called 'diffusion waves'. The wavenumbers from (v) represent pure propagating waves in the forward and reverse directions.

## ELECTROMECHANICS OF COMPRESSIBLE, INVISCID FLUIDS

PROBLEM 13.12 (continued)
Part d
If $\sigma$ is very large, then ( $m$ ) reduces to

$$
\begin{equation*}
\omega^{2}-k^{2} a^{2}-j \frac{H_{0}^{2}}{\rho_{0}} \frac{k^{4}}{\sigma \omega}=0 ; a^{2}=a_{s}^{2}+\frac{\mu_{0} H_{o}^{2}}{\rho_{0}} \tag{w}
\end{equation*}
$$

This can be put in the form

$$
\begin{equation*}
k^{2}=\frac{\omega^{2}}{a^{2}}-j \frac{f(\omega, k)}{\sigma} \tag{x}
\end{equation*}
$$

where

$$
f(\omega, k)=\frac{H_{0}^{2} k^{4}}{\rho_{0} \omega a^{2}}
$$

As $\sigma$ becomes very large, the second term in ( $x$ ) becomes negligible, and so

$$
\begin{equation*}
k^{2} \approx \frac{\omega^{2}}{a^{2}} \tag{y}
\end{equation*}
$$

However, it is this second term which represents the damping in space; that is,

$$
k \approx \pm\left[\frac{\omega}{a}-j \frac{f(\omega, k)}{2 \sigma \omega} a\right]
$$

Thus, the approximate decay rate, $k_{1}$, is

$$
\begin{equation*}
k_{i} \approx \frac{f(\omega, k) a}{2 \sigma \omega}=\frac{H_{0}^{2} k^{4}}{2 \rho_{0} \omega a^{2}} \frac{a}{\omega} \tag{aa}
\end{equation*}
$$

or

$$
k_{i} \approx \frac{H_{o}^{2}}{2 \rho_{0} a \sigma} \frac{k^{4}}{\omega^{2}}=\frac{H_{o}^{2}}{2 \rho_{0} a^{5} \sigma} \omega^{2}
$$
