8.286 Lecture 10 October 10, 2013

## INTRODUCTION TO NON-EUCLIDEAN SPACES

(After finishing dynamics of homogeneous expansion)

Alan Guth, Introduction to Non-Euclidean Spaces (After finishing dynamics of homogeneous expansion), 8.286 Lecture 10, October 10, 2013, p. 2.

Age of a closed universe:	(Want it in terms of $H$ and $\Omega$ )
$H^2 = \frac{8\pi}{3}G\rho - \frac{kc^2}{a^2}$	$\implies  \tilde{a} = \frac{a}{\sqrt{k}} = \frac{c}{ H \sqrt{\Omega - 1}} \; .$
$\alpha \equiv \frac{4\pi}{3} \frac{G\rho \tilde{a}^3}{c^2}  = $	$\implies  \alpha = \frac{c}{2 H } \frac{\Omega}{(\Omega - 1)^{3/2}} \; .$
$\frac{a}{\sqrt{k}} = \alpha(1 - \cos \theta)  \Longrightarrow $	$\frac{c}{ H \sqrt{\Omega-1}} = \frac{c}{2 H } \frac{\Omega}{(\Omega-1)^{3/2}} (1 - \cos\theta).$
$\implies$ Then $ct = \alpha(\theta - \sin \theta) =$	$\sin \theta = \pm \frac{\sqrt{\Omega - 1}}{\Omega} \ .$
$t = \frac{\Omega}{2 H (\Omega - 1)^{3/2}} \left\{ a t \right\}$	$\operatorname{rcsin}\left(\pm\frac{2\sqrt{\Omega-1}}{\Omega}\right)\mp\frac{2\sqrt{\Omega-1}}{\Omega}\right\} \ .$
	-3-

$t = \frac{\Omega}{2 H (\Omega-1)^{3/2}} \left\{ \arcsin\left(\pm \frac{2\sqrt{\Omega-1}}{\Omega}\right) \mp \frac{2\sqrt{\Omega-1}}{\Omega} \right\} .$					
Quadrant	Phase	Ω	Sign Choice	$\theta = \sin^{-1}()$	
1	Expanding	1 to 2	Upper	0 to $\frac{\pi}{2}$	
2	Expanding	2 to $\infty$	Upper	$\frac{\pi}{2}$ to $\pi$	
3	Contracting	$\infty$ to 2	Lower	$\pi$ to $\frac{3\pi}{2}$	
4	Contracting	2 to 1	Lower	$\frac{3\pi}{2}$ to $2\pi$	

## Evolution of an Open Universe

The calculations are almost identical, except that one defines

$$\tilde{a} \equiv \frac{a}{\sqrt{\kappa}}$$
, where  $\kappa \equiv -k > 0$ 

One finds hypergeometric functions instead of trigonometric functions, with

$$ct = \alpha(\sinh \theta - \theta)$$

$$\frac{a}{\sqrt{\kappa}} = \alpha(\cosh \theta - 1)$$
instead of
$$ct = \alpha(\theta - \sin \theta)$$

$$\frac{a}{\sqrt{k}} = \alpha(1 - \cos \theta)$$

$$\frac{1}{\sqrt{k}} = \alpha(1 - \cos \theta)$$

The Age of a Matter-Dominated Universe

$$\left( \frac{\Omega}{2(1-\Omega)^{3/2}} \left[ \frac{2\sqrt{1-\Omega}}{\Omega} - \sinh^{-1}\left( \frac{2\sqrt{1-\Omega}}{\Omega} \right) \right] \quad \text{if } \Omega < 1$$

$$H|t = \begin{cases} 2/3 & \text{if } \Omega = 1\\ \frac{\Omega}{2(\Omega - 1)^{3/2}} \left[ \sin^{-1} \left( \pm \frac{2\sqrt{\Omega - 1}}{\Omega} \right) \mp \frac{2\sqrt{\Omega - 1}}{\Omega} \right] & \text{if } \Omega > 1 \end{cases}$$

) = --

# Euclid's Postulates

- I. A straight line segment can be drawn joining any two points.
- 2. Any straight line segment can be extended indefinitely in a straight line.
- 3. Given a straight line segment, a circle can be drawn having the segment as radius and one endpoint as center.
- 4. All right angles are congruent.
- 5. If a straight line falling on two straight lines makes the interior angles on the same side less than two right angles, the two straight lines if produced indefinitely meet on that side on which the angles are less than two right angles

(a) "If a straight line intersects one of two parallels (i.e, lines which do not intersect however far they are extended), it will intersect the other also."

Alan Guth Alan Guth Massachusetts Institute of Technology 8.286 Lecture 10, October 10

-13-

### Equivalent Statements of the 5th Postulate

(b) "There is one and only one line that passes through any given point and is parallel to a given line."
