Lecture 11: Network Optimization  
The Network Simplex Algorithm

# Network Optimization

## Why do we care?

- Networks and associated optimization problems constitute reoccurring structures in many real-world applications.
- The network structure often leads to additional insight and improved understanding.
- Given integer data, the standard models have integer optimal solutions.
- The network structure also enables us to design more efficient algorithms.

# Network Optimization

## A Comparison

Sample Instance...

1,772 nodes and 2,880 arcs

# Network Optimization

## A Comparison

### Running Times

Algorithm	Running Time (sec)	# Iterations
Standard Simplex	334.59	42759
Network Simplex	7.37	23306
Ratio	2.2 %	54 %

Average over **5** random instances with **10,000** nodes and **25,000** arcs each.

### Outline

- The Simplex Algorithm: A Reminder
- The Network Simplex: A Combinatorial View
- The Network Simplex: An Animated View
- The Network Simplex: An Algebraic View

# The Simplex Algorithm

## A Reminder

The Problem...

$$\begin{aligned} \min \quad & c'x \\ \text{s.t.} \quad & Ax = b \\ & x \geq 0 \end{aligned}$$

# The Simplex Algorithm

## A Reminder

### The Algorithm

1. Start with basis  $B = [A_{B(1)}, \dots, A_{B(m)}]$  and BFS  $x$ .
2. Compute  $\bar{c}_j = c_j - c'_B B^{-1} A_j$ .
  - If  $\bar{c}_j \geq 0$ ;  $x$  optimal; stop.
  - Select  $j$  such that  $\bar{c}_j < 0$ .
3. Compute  $u = B^{-1} A_j$ .  $\theta^* = \min_{1 \leq i \leq m, u_i > 0} \frac{x_{B(i)}}{u_i} = \frac{x_{B(\ell)}}{u_\ell}$ .
4. Form a new basis by replacing  $A_{B(\ell)}$  with  $A_j$ .
5.  $y_j = \theta^*$ ;  $y_{B(i)} = x_{B(i)} - \theta^* u_i$ .

# The Network Simplex Algorithm

## The Problem

Combinatorially...

Determine a least cost shipment of a commodity through a network in order to satisfy demands at certain nodes from available supplies at other nodes. Arcs have costs associated with them.

# The Network Simplex Algorithm

## The Problem

Algebraically...

- Network  $G = (N, A)$ .
- Arc costs  $c : A \rightarrow \mathbb{Z}$ .
- Node balances  $b : N \rightarrow \mathbb{Z}$ .

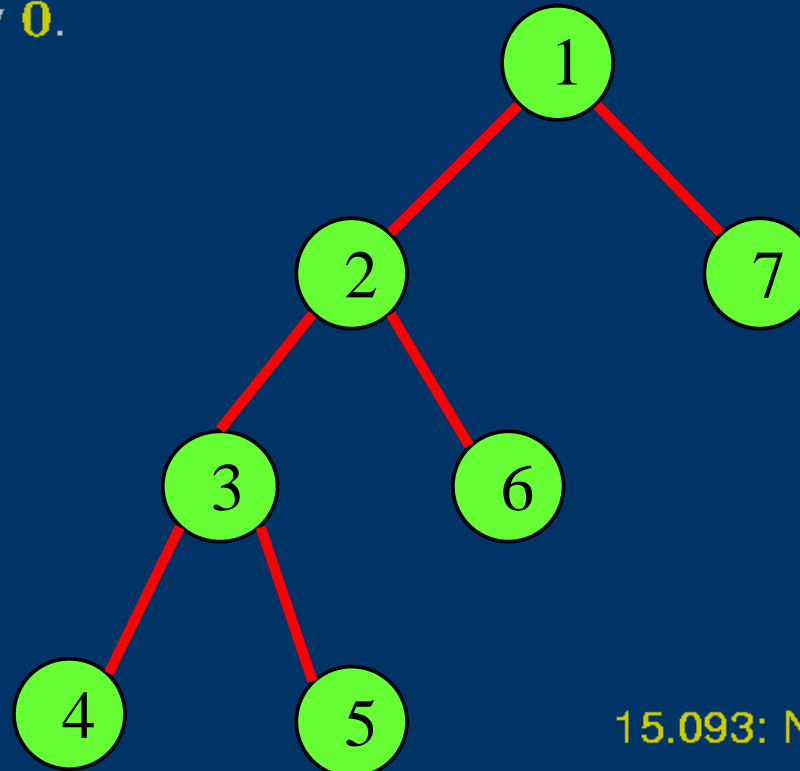

$$\begin{aligned} \min \quad & \sum_{(i,j) \in A} c_{ij} x_{ij} \\ \text{s.t.} \quad & \sum_{j:(i,j) \in A} x_{ij} - \sum_{j:(j,i) \in A} x_{ji} = b_i \quad \text{for all } i \in N \\ & x_{ij} \geq 0 \quad \text{for all } (i,j) \in A \end{aligned}$$

# The Network Simplex Algorithm

## Tree Solutions

### Definition...

- A *tree* is a graph that is connected and has no cycles.
- A *spanning tree* of a graph  $G$  is a subgraph that is a tree and contains all nodes of  $G$ .
- A flow  $x$  forms a *tree solution* with a spanning tree of the network if every non-tree arc has flow  $0$ .

# The Network Simplex Algorithm

## Tree Solutions

### Definition...

- A *tree* is a graph that is connected and has no cycles.
- A *spanning tree* of a graph  $G$  is a subgraph that is a tree and contains all nodes of  $G$ .
- A flow  $x$  forms a *tree solution* with a spanning tree of the network if every non-tree arc has flow  $0$ .

# The Network Simplex Algorithm

## Tree Solutions

### Definition...

- A *tree* is a graph that is connected and has no cycles.
- A *spanning tree* of a graph  $G$  is a subgraph that is a tree and contains all nodes of  $G$ .
- • A flow  $x$  forms a *tree solution* with a spanning tree of the network if every non-tree arc has flow  $0$ .

### Computing the Flow...

What is the flow in arc (7,1)?

# The Network Simplex Algorithm

## Tree Solutions

### Computing the Flow...

What is the flow in arc (1,2)?

# The Network Simplex Algorithm

## Tree Solutions

### Computing the Flow...

**Note:** there are two different ways of calculating the flow on (1,2), and both ways give a flow of 4. Is this a coincidence?

# The Network Simplex Algorithm

## Tree Solutions

### Trees vs. Tree Flows...

- Every tree flow has a corresponding tree (and perhaps more than one).
- Given a tree, we obtain a unique tree flow associated with it.

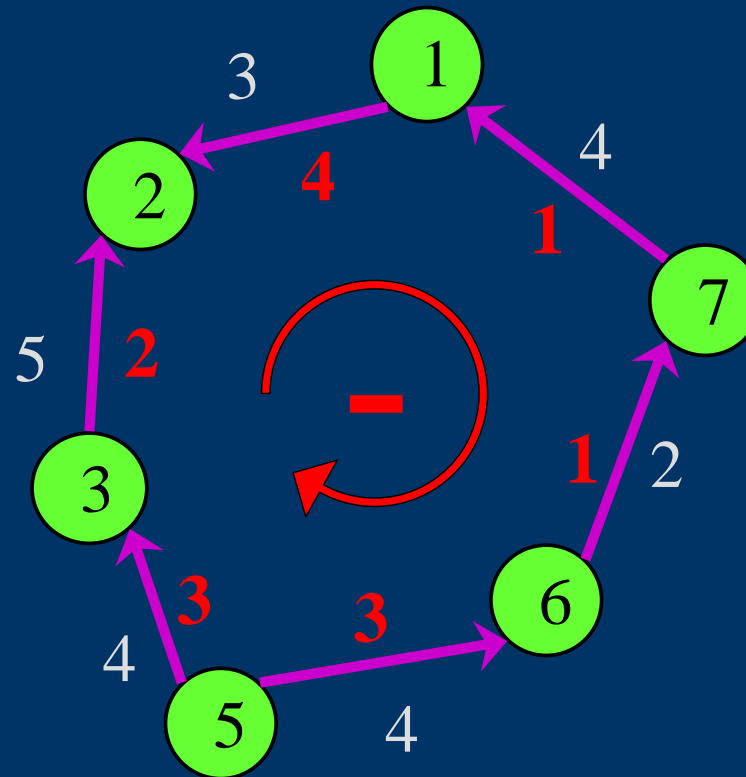

# The Network Simplex Algorithm

## Tree Solutions

### BFS Property...

**Theorem 1** *If the objective function is bounded from below, a min-cost flow problem always has an optimal tree solution.*

# The Network Simplex Algorithm

## Tree Solutions

### Optimality Condition...

**Theorem 2** A (feasible) tree  $T$  is optimal if, for some choice of node potentials  $p_i$ ,

- (a)  $\bar{c}_{ij} = c_{ij} - p_i + p_j = 0$  for all  $(i, j) \in T$ ,
- (b)  $\bar{c}_{ij} = c_{ij} - p_i + p_j \geq 0$  for all  $(i, j) \in A \setminus T$ .

Proof:

- $\min \sum_{(i,j) \in A} c_{ij} x_{ij}$  is equivalent to  $\min \sum_{(i,j) \in A} \bar{c}_{ij} x_{ij}$ .
- $\min \sum_{(i,j) \in A} \bar{c}_{ij} x_{ij}$  is equivalent to  $\min \sum_{(i,j) \in A \setminus T} \bar{c}_{ij} x_{ij}$ .
- For any solution  $x$ ,  $x_{ij} \geq x_{ij}^*$  for all  $(i, j) \in A \setminus T$ .

# The Network Simplex Algorithm

## Tree Solutions

Computing Node Potentials...

Here is a spanning tree with arc costs. How can one choose node potentials so that reduced costs of tree arcs are 0?

# The Network Simplex Algorithm

## Tree Solutions

### Computing Node Potentials...

There is a redundant constraint in the minimum cost flow problem.

One can set  $p_1$  arbitrarily. We will let  $p_1 = 0$ .

**What is the node potential for 2?**

# The Network Simplex Algorithm

## Overview of the Algorithm

1. Determine an initial feasible tree  $T$ . Compute flow  $x$  and node potentials  $p$  associated with  $T$ .
2. Calculate  $\bar{c}_{ij} = c_{ij} - p_i + p_j$  for  $(i, j) \notin T$ .
  - If  $\bar{c} \geq 0$ ,  $x$  optimal; stop.
  - Select  $(i, j)$  with  $\bar{c}_{ij} < 0$ .
3. Add  $(i, j)$  to  $T$  creating a unique cycle  $C$ . Send a maximum flow around  $C$  while maintaining feasibility. Suppose the exiting arc is  $(k, \ell)$ .
4.  $T := (T \setminus (k, \ell)) \cup (i, j)$ .

# Min-Cost Flow

Our reasoning has two important and far-reaching implications:

- There always exists an integer optimal flow (if node balances  $b_i$  are integer).
- There always exist optimal integer node potentials (if arc costs  $c_{ij}$  are integer).

# The Network Simplex Algorithm

## An Animation

# The Network Simplex Algorithm

## The Algebraic View

- Bases and trees.
- Dual variables and node potentials.
- Changing bases and updating trees.
- Optimality testing.

# The Network Simplex Algorithm

## The Algebraic View

### Bases vs. Trees...

The constraint matrix  $A$  of the min-cost flow problem is the node-arc incidence matrix of the underlying network.

	(1, 2)	(2, 6)	(3, 2)	(4, 3)	(4, 5)	(5, 3)	(5, 6)	(6, 7)	(7, 1)
1	+1	0	0	0	0	0	0	0	-1
2	-1	+1	-1	0	0	0	0	0	0
3	0	0	+1	-1	0	-1	0	0	0
4	0	0	0	+1	+1	0	0	0	0
5	0	0	0	0	-1	+1	+1	0	0
6	0	-1	0	0	0	0	-1	+1	0
7	0	0	0	0	0	0	0	-1	+1

The rows of  $A$  are linearly dependent.

1	0	0	0	-1	0	+1

Permuting Columns

# The Network Simplex Algorithm

## The Algebraic View

...Bases vs. Trees...

### Corollary 1

- (a) *The matrix  $A$  has rank  $n - 1$ .*
- (b) *Every tree solution is a basic solution.*

# The Network Simplex Algorithm

## The Algebraic View

...Bases vs. Trees...

**Theorem 3** *Every tree defines a basis and, conversely, every basis defines a tree.*

Suppose the graph defined by a basis contains a cycle **1 – 2 – 3 – 4 – 5 – 6**:

	(1, 2)	(2, 3)	(4, 3)	(5, 4)	(5, 6)	(1, 6)
1	+1	0	0	0	0	+1
2	-1	+1	0	0	0	0
3	0	-1	-1	0	0	0
4	0	0	+1	-1	0	0
5	0	0	0	+1	+1	0
6	0	0	0	0	-1	-1

# The Network Simplex Algorithm

## The Algebraic View

### Dual Variables vs. Node Potentials...

Remember, the simplex algorithm computes the dual variables  $p$  as the solution to  $p' B = c'_B$ .

$$(p_4, p_5, p_6, p_7, p_3, p_2) \begin{pmatrix} +1 & 0 & 0 & 0 & 0 & 0 \\ 0 & +1 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & +1 & 0 & 0 \\ -1 & -1 & 0 & 0 & +1 & 0 \\ 0 & 0 & +1 & 0 & -1 & -1 \end{pmatrix} = (c_{43}, c_{53}, c_{26}, c_{71}, c_{32}, c_{12})$$

Hence,  $p_2 = -c_{12}$ ,  $p_3 = c_{32} + p_2$ ,  $p_7 = c_{71}$ , ...

# The Network Simplex Algorithm

## The Algebraic View

### Optimality Testing...

Remember, the simplex algorithm computes the reduced costs  $\bar{c}$  as  $\bar{c}_{ij} = c_{ij} - p'_i A_{ij}$ .

	(1, 2)	(2, 6)	(3, 2)	(4, 3)	(4, 5)	(5, 3)	(5, 6)	(6, 7)	(7, 1)
1	+1	0	0	0	0	0	0	0	-1
2	-1	+1	-1	0	0	0	0	0	0
3	0	0	+1	-1	0	-1	0	0	0
4	0	0	0	+1	+1	0	0	0	0
5	0	0	0	0	-1	+1	+1	0	0
6	0	-1	0	0	0	0	-1	+1	0
7	0	0	0	0	0	0	0	-1	+1

Therefore,  $\bar{c}_{ij} = c_{ij} - p_i + p_j$ .

# The Network Simplex Algorithm

## Summary

- The network simplex algorithm is extremely fast in practice.
- Relying on network data structures, rather than matrix algebra, causes the speedups. It leads to simple rules for selecting the entering and exiting variables.
- Running time per pivot:
  - arcs scanned to identify an entering arc,
  - arcs scanned of the basic cycle,
  - nodes of the subtree.
- A good pivot rule can dramatically reduce running time in practice.
